

Future Typewriter

Technologies for producing printed text have come a long way since the advent of the printing press in 1450 and the first commercially successful typewriter in 1867 (invented by Christopher Sholes). The computers and printers that we have today are certainly not the end of the line.

Assignment:

1. Use your knowledge of current technologies and your imagination to design the type machine of the future. What features might it have? How will it be used?
2. Label and describe your machine in a Microsoft Word document (remember to use proper MLA formatting).
3. Use Paint to draw your machine. Import the picture into the body of your Word document.
